

CS683 Project Assignment

iperf3 network tester Jerold (Jerry) Abramson - April 19, 2026

Response to specific iteration 2 feedback

1. I decided to put together a separate document to address concerns, questions asked as part of the last iterations feedback.
2. I have already recorded four videos that provide extensive demos of running code, so any changes at this point could possibly invalidate that work.
3. I have also completed the project report, and didn't want to modify that at this stage.
4. Instead, will answer each feedback question individually and provide a separate source code supplemental release with the project submission.
5. I will also put together a very short video addressing and/or presenting these items.

Navigation

I only have one screen, so the NavGraph isn't specifically required.

I was thinking that I might want additional screen at some point in the future.

For now I am going to remove this code and include it in the supplemental release.

Persistent Data

I do not currently have any persistent data, but I do have plans to add this once the main architectural issue with the iperf3 executable is addresses.

My videos go into some details on this goal.

ExtractBinary

My fourth video has a section where I login to a real Android device and show the application folder that contains the iperf3 executable that was delivered as part of the application.

Process Leakage

Although I addressed this conceptually is a good idea to login to both the Emulator, and Android device, and execute 'ps' commands to ensure that the process is always destroyed.

CommandLineBuildApp.md

This is a trivial change that I can make in the main branch.
